

Brainstorming – Idea Generation & Prioritization

Implement Client Script & UI Policy (Incident) for NM Project
Date: 03 October 2026 | Team ID: NM-TEAM-ID

Step 1 – Problem Selection

Selected problem: inconsistent Incident form behavior caused by missing dynamic validation and field controls.

Step 2 – Brainstormed Ideas

UI Policy: make Resolution Notes mandatory when State = Resolved.

UI Policy: make Resolution Code mandatory when State = Resolved.

UI Policy: make On Hold Reason mandatory when State = On Hold.

UI Policy: hide/disable fields that are not relevant to the current incident state.

onChange Client Script: calculate Priority from Impact and Urgency.

onSubmit Client Script: block submission when a resolved incident lacks resolution details.

onLoad Client Script: display a short form guidance message.

Use server-side Business Rules for data integrity where client-side controls are bypassable.

Step 3 – Prioritization

The implementation prioritizes state-based UI Policies and Impact/Urgency priority calculation because they directly address completeness, usability, and validation on the Incident form.

Idea Prioritization

Idea	User Value	Implementation Effort	Priority
Resolved-state mandatory fields	High	Low	P1
On Hold reason mandatory	High	Low	P1
Impact/Urgency priority calculation	High	Medium	P1
OnLoad guidance message	Medium	Low	P2
Advanced server-side validation	High	Medium	P2
