

Define the Problem Statement

Implement Client Script & UI Policy (Incident) for NM Project
Date: 03 October 2026 | Team ID: NM-TEAM-ID

Customer Problem Statement

Incident handling in ServiceNow becomes inconsistent when field behavior is controlled only by user knowledge. Agents may leave important fields incomplete, change fields that should be locked, or enter resolution information before the incident reaches the correct state.

The proposed NM project applies Client Scripts and UI Policies on the Incident form so that the interface guides the agent, enforces required information, and prevents invalid submissions without changing server-side business data unnecessarily.

Problem Statement

As a ServiceNow Incident Agent, I need the Incident form to dynamically control field visibility, mandatory status, and validation based on the incident state and priority conditions, so that incidents are created and resolved with complete and consistent information.

Project Scope

- Incident table (incident)
- Client-side validation and dynamic field behavior
- UI Policies for state-based field behavior
- Testing with positive and negative scenarios
- Documentation of configuration and results

Problem Statement Template

PS ID	I am (Customer)	I’m trying to	But	Because	Which makes me feel
PS-1	Incident Agent	Create/update incidents correctly	Fields can be incomplete or editable at the wrong time	Manual checking is inconsistent	Concerned about incorrect incident records
PS-2	Incident Manager	Ensure resolved/on-hold incidents contain required details	Agents may submit without resolution/hold information	Form behavior is not automatically enforced	Concerned about data quality
