

# Proposed Solution – ServiceNow Incident Automation

Implement Client Script & UI Policy (Incident) for NM Project  
Date: 03 October 2026 | Team ID: NM-TEAM-ID

## Solution Summary

A ServiceNow Incident form enhancement that combines Client Scripts and UI Policies. UI Policies manage field state (mandatory/visible/read-only) while Client Scripts perform dynamic calculations and submission validation.

## Solution Parameters

| S.No. | Parameter                             | Description                                                                                                                         |
|-------|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | Problem Statement                     | Incident form entries may be incomplete or inconsistent, especially during On Hold and Resolved states.                             |
| 2     | Idea / Solution description           | Implement state-based UI Policies and Client Scripts for priority calculation and submit validation.                                |
| 3     | Novelty / Uniqueness                  | Combines immediate UI guidance with event-driven client validation tailored to Incident lifecycle states.                           |
| 4     | Social Impact / Customer Satisfaction | Reduces avoidable rework for service agents and improves consistency of incident records.                                           |
| 5     | Business Model                        | Internal enterprise workflow improvement; value is measured through reduced manual correction and improved service-desk efficiency. |
| 6     | Scalability                           | Additional Incident states, fields, roles, and validation rules can be added using modular Client Scripts and UI Policies.          |
