

Final Project Report – ServiceNow Incident Automation

Implement Client Script & UI Policy (Incident) for NM Project

Date: 03 October 2026 | Team ID: NM-TEAM-ID

Executive Summary

This project implements Client Scripts and UI Policies for the ServiceNow Incident form. The solution improves data quality by dynamically controlling fields and automating priority calculation.

Problem

Incident agents can enter incomplete information or manually select values inconsistently when form behavior is not guided.

Proposed Solution

Use UI Policies for state-based field controls and Client Scripts for dynamic priority calculation and final client-side validation.

Implementation

Two core UI Policies and two Client Scripts are proposed. The configuration is tested using functional and UAT scenarios.

Expected Outcome

More consistent incident records, fewer invalid submissions, clearer agent guidance, and reduced manual correction.

Evidence Required

Screenshot 1: Incident form before rule trigger.

Screenshot 2: Resolved state with mandatory resolution fields.

Screenshot 3: On Hold state with mandatory On Hold Reason.

Screenshot 4: Priority updated from Impact/Urgency.

Screenshot 5: Invalid resolved submission blocked.

Screenshot 6: Valid resolved submission successful.

Conclusion

The ServiceNow Incident Client Script and UI Policy configuration provides a focused, maintainable approach to form-level automation. Final production use should follow instance-specific validation, testing, and change-management procedures.
