

Solution Architecture – ServiceNow Incident Client Script & UI Policy

Implement Client Script & UI Policy (Incident) for NM Project
Date: 03 October 2026 | Team ID: NM-TEAM-ID

Architecture

The design uses native ServiceNow configuration on the Incident table. The user interacts with the Incident form. Client Scripts respond to form events and UI Policies respond to field conditions. Validated values are submitted to the Incident record.

Architecture Flow

Incident Agent

↓

ServiceNow Incident Form

└─ UI Policies → mandatory / visible / read-only behavior

└─ onChange Client Script → Impact + Urgency → Priority

└─ onSubmit Client Script → final client-side validation

└─ onLoad Client Script (optional) → initial form guidance

↓

ServiceNow Incident Record

↓

Incident lifecycle / audit / reporting

Configuration Components

UI Policy 1: Resolved State – make Resolution Code and Resolution Notes mandatory.

UI Policy 2: On Hold State – make On Hold Reason mandatory.

Client Script 1: Calculate Priority on Impact or Urgency change.

Client Script 2: Validate Resolved incident on submit.

Optional Client Script 3: Display initial guidance on load.

Design Principle

Use UI Policies for declarative field behavior and Client Scripts only where dynamic calculation or validation is required. Server-side ACLs/Business Rules remain the authoritative control for security and data integrity.
